

Operating Note ° 5 – 28.12.2017 (continuation 1)

REGANOSA PLANT UNAVAILABILITY DUE TO ELECTRICAL POWER SUPPLY MAINTENANCE

EXCEPTIONAL OPERATION SITUATION LEVEL 0

As announced at the beginning of this Operating Note, on the occasion of the execution of repair works on the electric connection that feeds the Mugarodos regasification plant, said plant will remain unavailable for the emission to the transport network, tanker loading and loading and unloading ships between 07:00 h December 29th until 15:00 h January 1st, which implies the declaration of Exceptional Operation Situation level 0 during those days.

Because of this unavailability the Galicia and Asturias area will be fed from the rest of the System through de Ruta de la Plata pipeline, the Burgos-Santander-Asturias pipeline and the International Connection of Tuy. With the latest conventional demand forecast in the northwest area, coverage is guaranteed for all the conventional demand and up to 12 GWh/day of electricity generation demand from the Combined Cycles Thermal Plants located in the area.

According with what it is stated in the Action Plan for Emergency Cases 2017/2018, the Technical System Operator maintains permanent coordination with Spanish Electrical Grid Operator to guarantee the security of supply in the electric system at all times.

We remind you that linked to this maintenance there is a second stop phase between 07:00 h January 5th and 15:00 h January 8th, which is pending confirmation based on the weather forecasts for the previous days, which will be notified as a continuation of this Operating Note.
